

 **New York** Blood Center

# BAD TO THE BONE...MARROW

# OBJECTIVES

- Discuss the need for accurate patient medical history.
- List the benefits of genotyping BMT recipients and donors prior to transplantation.

# PATIENT ADMIT INFORMATION

Patient is a Caucasian female

- Age
  - 25yrs
- Diagnosis
  - Hodgkin's lymphoma
- Transfusion history
  - No prior transfusions

# INFORMATION FROM HOSPITAL BLOOD BANK

- Getting weak back type
- DAT 1+ IgG – did not prepare eluate
- Antibody reactivity at all phases
- Patient is difficult in giving consent to be drawn

# JUNE 2015 – INITIAL IRL TESTING RESULTS

# WHAT DO WE KNOW?

## ABO/Rh

- inconclusive, mixed field reactions for ABO
- Rh appears to be negative

## DAT

- Positive
  - Need to prepare eluate

## Plasma

- Apparent anti-D, anti-K and ?
  - More work needed still need to rule in/out anti-E and anti-Fy<sup>a</sup>

# ELUATE RESULTS

# WHAT OTHER INFORMATION DO WE NEED?

- Mixed field reactions?
  - Has the patient really had no transfusions?
    - There are no records for her in our computer
  - Could someone please speak to the patient or her family to verify there have not been any recent transfusions?
    - Maybe when she had the BMT
- When?
  - She received a BMT in February 2015
- Where?
  - Contact the facility

# WHAT THE OTHER GUYS KNEW

- The patient typed as B Positive and in February 2015 received an O Negative BMT.
- Since that time she was found to have anti-D, anti-K and a warm autoantibody.

# WHAT WE KNOW...NOW

## ABORh

- consistent with a BMT patient historically B Positive receiving an O Negative

## Plasma

- anti-D and anti-K, also reactivity with one D-negative, K-negative cell with no apparent specificity

## Eluate

- Weakly reactive with 7 of 20 cells; no specificity was apparent.

Any ideas on what else to do?

# SIX MONTHS LATER...SHE IS BACK

- December 2<sup>nd</sup> the patient is back
- Hgb: 5.4
- DX: WAIHA, severe anemia; encephalopathy, Hodgkin's Lymphoma in relapse; patient to receive probable exchange transfusion or plasma pheresis
- Patient history: BMT B+ to O-; anti-D, anti-K in the plasma; and weak unidentified in plasma and eluate.
- Hospital will not transfuse unless patient drops below 5g Hgb
- Patient has not been recently transfused

# HEMOGLOBIN DROPS

12-2: 2 rbcs, group O; D-, K-

12-3: 4 rbcs; group O; D-, K-

12-4: 3 rbcs; group O; D-, K-

12-5: 2 rbcs; group O; D-, K-

12-6: 4 rbcs; group O; D-, K-

12-7: 3 FFP

A call is made to the reference lab...

# DECEMBER 7<sup>TH</sup>... THE CALL

# NOW WHAT?

- Plasma panel is all positive; however, it is stronger with c+ cells
- The acid eluate is agglutinated after washing – what does this mean?
- Any suggestions?

# ALLO ADSORPTIONS

R<sub>1</sub>R<sub>1</sub> cell; K-; Fy(a+b-); Jk(a-b+); S-, s+

# WHAT DOES IT ALL MEAN?

## ABO/Rh

- ABO was consistent with previous results
- Rh?

## Eluate

- Probable WAIHA

## Plasma

- WAIHA (also: rouleaux observed with all cells at LISS 37C)

## Alloodsorbed plasma

- Anti-c is present

# WHAT ABOUT DNA?

IRL uncomfortable performing serologic and blood DNA

- Why?
  - Patient reported to only be 98% engrafted
- Options?
  - Buccal swab of patient to obtain original genotype
    - Submitting client did not want to do this
  - Unable to obtain BMT source genotype/phenotype

# WELL...WHAT HAPPENED?

12-8: at 08:15 Hgb: 4.5g;

- Transfused 2 rare rbcs: O-, c-, K-. This did not work. The patient's hemoglobin continued to drop.
- Transfused 1 rbc: O-, K-, and 4 FFP

12-9: at 04:10 Hgb: 5.0g;

bilirubin: 8

direct bilirubin: 0.9

Hospital to perform plasma pheresis and RBC exchange:

- RBC exchange used 8 rbcs: O-, K-

In total the patient received:

- 23 O neg, K- rbcs
- 2 O neg, K-, c- rbcs
- 5 group O, FFP
- 2 group A, FFP – yes, group A

# AND...

The submitting hospital blood bank received a Christmas card from the patient to Thank them for giving her...

# The End

 **New York** Blood Center
